The Atlas of Landscape Character Types of Belgrade presents the results of a **complex, no linear methodological approach**, while the creation of contextual and graphical design related to the interpretation of landscape value depicts part of the scientific and educational process which has been carried out in the **Landscape Laboratory at the Department of Landscape Architecture and Horticulture**.

In this study, the authors showed how **fuzzy research methodology** informed by the complexity of landscape theory could **capture new insights into ecosystem services and landscape sensitivity**, advancing a variety of landscape guidelines applications. This research is inspired by European Landscape Convention and its implementation in the Serbian spatial planning legislation.
